

# HIV Prevention Research Tools Assessment

(Version 4.0, 16 Questions, HPR Module Assessment)

The following assessment measures knowledge of HIV Prevention modalities. It includes questions on **Vaccines, Pre-Exposure Prophylaxis (PrEP), Microbicides, and Treatment as Prevention (TasP)**. This assessment contains key questions and expanded explanations of the answers.

When using this tool as a pre-post assessment, or when linking demographics to responses please have respondents include an ID (e.g. a number, initials, etc.) in the boxes labeled “ID.”

This assessment was developed by Be the Generation Bridge, a collaborative project between the Legacy Project and FHI360, in conjunction with HPTN, HVTN, and MTN. For more information, contact Legacy Project at 206-667-1194 or visit [www.hanc.info](http://www.hanc.info).

# HIV Prevention Research Tools Assessment

(Version 4.0, 16 Questions, HPR Module Assessment)

Clinical studies assessing how well new medicines or medical devices help prevent new HIV infections are called *HIV prevention research*. Please indicate whether you believe the following statements to be true or false. If you are unsure, feel free to select “don’t know.”

		True	False	Don't know
1.	Scientists have already developed a vaccine that prevents HIV infection.	T	F	DK
2.	Volunteers for preventive HIV vaccine studies can get HIV from the vaccines being tested.	T	F	DK
3.	HIV vaccines train the body to recognize the HIV virus if a person gets infected.	T	F	DK
4.	HIV vaccines contain live HIV virus.	T	F	DK
5.	PrEP is a way to prevent HIV by taking HIV treatment medication after exposure to the virus.	T	F	DK
6.	PrEP has been shown to reduce the risk for HIV infections among gay men.	T	F	DK
7.	PrEP is an HIV prevention method intended for use by HIV-infected people.	T	F	DK
8.	Researchers do not know whether there are health risks from using PrEP for long periods of time.	T	F	DK
9.	Microbicides refer to pills taken orally to prevent HIV infection.	T	F	DK
10.	Microbicides are only being tested among women.	T	F	DK
11.	Most microbicides tested today contain HIV antiretroviral drugs which are used to treat people living with HIV/AIDS.	T	F	DK
12.	There are possible health risks associated with participating in HIV microbicides clinical studies.	T	F	DK
13.	An HIV-infected pregnant woman who takes ARVs as prescribed will reduce the chance of transmitting HIV to her child.	T	F	DK
14.	TasP was 96% effective in preventing HIV infections in heterosexual couples.	T	F	DK
15.	Treatment of HIV-infected people with antiretroviral therapy (ART) does not reduce their chance of transmitting HIV to their partner who is not infected with HIV.	T	F	DK
16.	Prevention research has been so effective that study participants no longer need to use condoms during sexual intercourse.	T	F	DK

Please complete this form so that data may be analyzed accurately.

Event \_\_\_\_\_ Date \_\_\_\_\_

With which racial or ethnic groups do you identify? (Check all that apply)

- African American/Black
- Alaska Native (Tribal Affiliation(s): \_\_\_\_\_)
- American Indian (Tribal Affiliation(s): \_\_\_\_\_)
- Asian American
- Latino/Latina/Hispanic
- Native Hawaiian or Other Pacific Islander
- White Caucasian
- Other (Specify: \_\_\_\_\_)
- Decline to State

How old are you?

- Under 18 years old
- 18-20 years old
- 21-24 years old
- 25-29 years old
- 30-39 years old
- 40-49 years old
- 50 years old or older

What is the highest level of education you have completed? (Check one)

- No High School Degree or GED
- High School Degree or GED
- Some College, Did Not Receive Degree or Certificate
- AA degree/Vocational Certificate
- 4-Year College Degree (BA/BS)
- Master's Degree
- Doctorate/Medical/Law Degree

What is your gender? (Check all that apply)

- Man/Male
- Woman/Female
- Transgender
- Genderqueer
- Gender Non-Conforming

What is your sexual identity?

- Straight or Heterosexual
- Gay, Lesbian, or Homosexual
- Bisexual
- I do not identify with any sexual identity
- Other (Please specify: \_\_\_\_\_)

# HIV Prevention Research Tools Assessment

(Version 4.0, 16 Questions, HPR Module Assessment)

## ANSWER KEY

- 1. Scientists have already developed a vaccine that prevents HIV infection.** **F**

Currently, there is not a licensed vaccine to prevent HIV. Research is being conducted to find a safe and effective preventive HIV vaccine. In order to find one, researchers will need thousands of volunteers to participate in clinical trials.
- 2. Volunteers for preventive HIV vaccine studies can get HIV from the vaccines being tested.** **F**

The HIV vaccines used in clinical trials cannot cause HIV infection or AIDS, and volunteers are not exposed to the HIV virus through the study. However, volunteers in clinical trials can get HIV from other people through unprotected sex or drug use.
- 3. HIV vaccines train the body to recognize the HIV virus if a person gets infected.** **T**

Vaccines would teach the body to recognize the virus, sounding an internal “alarm” which calls the fighter cells into action, and ultimately helps prevent or control an infection.
- 4. HIV vaccines contain live components of the HIV virus.** **F**

HIV vaccines do not contain either live or killed forms of the virus. The vaccines are synthetic (man-made) compounds designed to trigger immune responses that will help your body recognize and fight the HIV virus. There is no real virus or infected material in the vaccine, so there is no way that it can cause HIV/AIDS.
- 5. PrEP is a way to prevent HIV by taking HIV treatment medication after exposure to the virus.** **F**

Pre-exposure prophylaxis involves prescribing people not infected with HIV medicine to prevent rather than treat a disease or condition. People would consistently take a single drug or combination of drugs with the hope that it would lower their risk of infection if they later get exposed to HIV.
- 6. PrEP has been shown to reduce the risk for HIV infections among gay men.** **T**

The iPrEx PrEP trial for gay men, transgender women, and men who have sex with men was a landmark in HIV prevention research. Results showed use of PrEP was 44% effective in reducing the risk of HIV infection among trial participants.
- 7. PrEP is an HIV prevention method intended for use by HIV-infected people.** **F**

PrEP is an HIV prevention strategy in which people not infected with HIV are prescribed a daily dose of the antiretroviral medication (ARV) Truvada® to reduce risk of HIV infection.

8. **Researchers do not know whether there are health risks from using PrEP for long periods of time.** T
- To date, PrEP studies have been relatively short in duration (e.g. 12-18 months). Medications tested as PrEP are the same used to treat people with HIV. Some of these medications carry health risks (e.g. kidney damage) among HIV-infected people when used over several years. Researchers do not know whether similar or other health risks will occur among not infected with HIV people if used over a long time or when used only occasionally.
9. **Microbicides refer to pills taken orally to prevent HIV infection.** F
- Microbicides are being developed to reduce a person's risk of HIV or other sexually transmitted infections when applied topically inside the vagina or rectum. Microbicides could take the form of gels, lubricants, rings or films. Oral pre-exposure prophylaxis (PrEP), on the other hand, is an HIV prevention approach that involves use of an antiretroviral pill by people not infected with HIV.
10. **Microbicides are only being tested among women.** F
- Although the majority of microbicides research has focused on products to be used in the vagina, research is also underway on products that men and women could use during anal sex. According to estimates, 5 to 10 percent of the world's population engages in anal sex.
11. **Most microbicides tested today contain HIV antiretroviral drugs which are used to treat people living with HIV/AIDS.** T
- Different types of microbicides are being tested in clinical trials, but those that incorporate antiretroviral (ARV) drugs are furthest along in development and testing. The idea behind ARV-based microbicides is that some of the same drugs used to treat HIV may also help prevent infection in people who are not infected with HIV.
12. **There are possible health risks associated with participating in HIV microbicides clinical studies.** T
- There are risks involved in participating in any clinical trial. Researchers in the HIV prevention field strive to minimize these risks by incorporating a multi-tiered safety review process into clinical studies, and by conducting them under the watchful eye of regulatory and research authorities.
13. **An HIV-infected pregnant woman who takes ARVs as prescribed will reduce the chance of transmitting HIV to her child.** T
- HIV-infected pregnant women are provided ARVs to reduce the chance of transmitting HIV to their baby. Without intervention there is a 20-45% chance that a baby born to an HIV-infected mother will become infected. Mothers who adhere to ARVs during pregnancy, labor and delivery, and then give ARV to their newborns can reduce the rate of mother-to-child transmission to as low as 2%.

14. **TasP was 96% effective in preventing HIV infections in heterosexual couples.** T

The HPTN 052 study of couples (one HIV-infected and one not infected with HIV) determined that early use and adherence to ARVs was 96% effective in preventing HIV infection of the partner not infected with HIV. This strategy is recommended in conjunction with other risk-reduction interventions, including adherence support, counseling, and consistent use of condoms. Each tool is an important component in preventing HIV infection.

15. **Treatment of HIV-infected people with antiretroviral therapy (ART) does not reduce their chance of transmitting HIV to their partner not infected with HIV.** F

Getting HIV-infected people into treatment and keeping them in care, also known as treatment as prevention (TasP), has proven successful in reducing a person's viral load, therefore, making them less likely to pass the virus to their partner not infected with HIV.

16. **Prevention research has been so effective that study participants no longer need to use condoms during sexual intercourse.** F

Condoms are an extremely effective method to prevent the transmission of HIV and other sexual infections. People should still use condoms together as part of their STI prevention "toolbox."
